

LIEBERT® SN™ SENSORS

Flexible rack sensor solutions

Remote Visibility into Rack Conditions

.Vertiv Liebert SN sensors offer a range of options for monitoring temperature, humidity, fluid leaks and contact closures within computer rooms and network closets to protect equipment from dangerous conditions and enable more efficient thermal management. Available in modular and integrated configurations, Vertiv Liebert SN sensors are easy to mount and connect directly to Liebert PDUs, Liebert UPS systems with the Unity DP communications card, and Avocent ACS serial consoles. Modular configurations feature separate sensors with input and output ports that allow them to be daisy-chained to connect multiple sensors to one input for the ultimate in flexibility. Integrated sensors feature one or more probes integrated with a cable for fast, simple installation. With either configuration you can monitor temperature at one or multiple points on a rack as well as humidity, leaks and rack door status. Vertiv Liebert SN sensors feature a compact sensor design, are auto-discoverable and include all cables and mounting hardware. They can operate as a standalone monitoring solution or can be integrated into the Liebert Nform monitoring platform.

Flexible design allows sensors to be configured to application requirements

Plug-and-play compatibility with Vertiv rack-mount products, including Liebert UPS systems and PDUs and Avocent ACS serial consoles

Alarm notification includes email alerts when conditions exceed set thresholds

Includes all cables and mounting hardware
